

Docker Image Vs Docker Container

ajay patel
@iamajaypatel

DOCKER

Images

Templates for containers

Contains code, dependencies, runtime

Layer-based, read-only.

Containers

The running instance of Image.

Multiple container can be created based on one image.

Read and Write access. Data is lost on shutdown.

One Image, Multiple Containers

ajay patel
@iamajaypatel

How to get an Image?

Use an existing, pre-built image

From

Docker Hub

Microsoft Container Registry

Other private registry

Create your custom image

Write your own Dockerfile

.net info 

1

Downloading Images:

The docker pull command is used to download an image from the repository so that it is available locally.

docker pull imagename:tag

ex: docker pull node

if you don't specify tag, it will pull latest image.

docker run imagename:tag

docker run download an image from repository if it is not available locally and create and start the container.

Create custom Image:

docker build -t name:tag .

Dockerfile

ENTRYPOINT ["dotnet","example.dll"]

COPY ..

WORKDIR /app

Base image from docker hub/ microsoft
registry

.net info 

Container based on Image

docker run imagename:tag

ajay patel

@iamajaypatel

Key Commands for image:

Build an image: `docker build -t name:tag .`

Inspect an image: `docker inspect name/id`

Remove an image: `docker rmi name/id`

Remove all images: `docker image prune`

Pull an image: `docker pull name:tag`

NOTE: `docker image prune` will remove only untagged images. If you want to remove tagged images as well add **-a** with command.

AJAY

.net info 

Key Commands for container:

- **docker create *imagename*:** Create new container.
- **docker run *imagename*:** Create and start new container based on image.
- **docker stop *containername*:** Stop a running container.
- **docker start *containername*:** Start a stopped container.
- **docker rm *containername*:** Remove specified container.
- **docker container prune:** Remove all containers.
